# INTRODUCTION

The mechanical drive train comprises individual units such as motor, gear unit and driven machine. The coupling connects these component assemblies.

As well as the transmission of rotary motion and torque, other requirements may be made of the coupling.

- Compensation for shaft misalignment with low restorative forces
- Control of characteristic angular vibration frequency and damping
- Interruption or limitation of torque
- Noise insulation, electrical insulation

Couplings are frequently chosen after the machines to be connected have already been selected. Thanks to a large number of different coupling assembly options, specified marginal conditions for clearance and connection geometry can be met from the standard range. The coupling also performs secondary functions, e.g. providing a brake disk or brake drum for operating or blocking brakes, devices to record speed or the attachment of sprockets or pulleys.

Couplings are divided into two main groups, couplings and clutches.

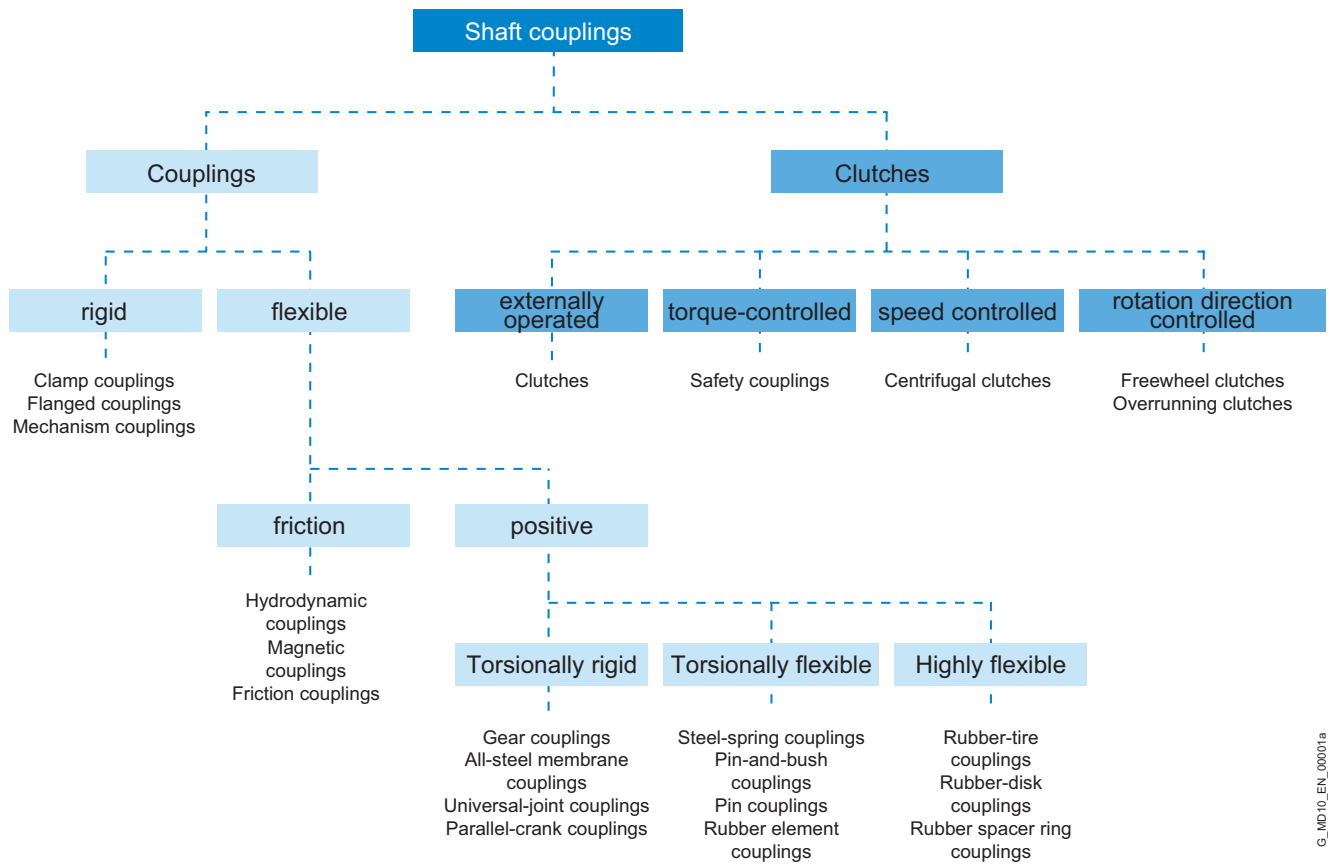

Clutches interrupt or limited the transmissible torque. The engaging and disengaging forces on externally operated clutches are introduced via a mechanically, electrically, hydraulically or pneumatically operating mechanism. Overload, centrifugal or freewheel clutches draw their engaging energy from the transmitted output.

Rigid couplings, designed as clamp, flanged or mechanism couplings, connect machines which must not undergo any shaft misalignment. Hydrodynamic couplings, often also called fluid or Föttinger couplings, are used as starting couplings in drives with high mass moments of inertia of the driven machine. In drive technology very often flexible, positive couplings, which may be designed to be torsionally rigid, torsionally flexible or highly flexible, are used.

Torsionally rigid couplings are designed to be rigid in a peripheral direction and flexible in radial and axial directions. The angle of rotation and torque are conducted through the coupling without a phase shift.

Torsionally flexible couplings have resilient elements usually manufactured from elastomer materials. Using an elastomer material with a suitable ShoreA hardness provides the most advantageous torsional stiffness and damping for the application. Shaft misalignment causes the resilient elements to deform.

Highly flexible couplings have large-volume (elastomer) resilient elements of low stiffness. The angle of rotation and torque are conducted through the coupling with a considerable phase shift.

# OUR COUPLING GROUPS AT A GLANCE

N-EUPEX, RUPEX and N-BIPEX

## Flexible Couplings

Flexible Flender couplings have a wide range of possible applications. A broad standard modular system as well as specially designed application-specific couplings are available.

**N-EUPEX**  
cam couplings  
Rated torque:  
19 Nm ... 85,000 Nm

**RUPEX**  
pin-and-bush couplings  
Rated torque:  
200 Nm ... 1,690,000 Nm

**N-BIPEX**  
cam couplings  
Rated torque:  
12 Nm ... 4,650 Nm

ELPEX, ELPEX-B and ELPEX-S

## Highly Flexible Couplings

ELPEX® couplings are free of circumferential back-lash. Their damping capacity and low torsional stiffness make them especially well-suited for coupling machines with strongly non-uniform torque characteristics or large shaft misalignment.

**ELPEX**  
elastic ring couplings  
Rated torque:  
1,600 Nm ... 90,000 Nm

**ELPEX-B**  
elastic tire couplings  
Rated torque:  
24 Nm ... 14,500 Nm

**ELPEX-S**  
rubber disk couplings  
Rated torque:  
330 Nm ... 63,000 Nm

ZAPEX gear couplings and ARPEX all-steel couplings

### Torsionally rigid couplings

For transmission of high torques, we offer both ARPEX all-steel couplings and ZAPEX gear couplings in a range of versions. Their purposes of application vary according to specific requirements with respect to shaft misalignment, temperature and torque.

**ZAPEX**  
gear couplings  
Rated torque:  
1,300 Nm ... 7,200,000 Nm

**ARPEX**  
high Performance Couplings  
Rated torque:  
1,000 Nm ... 588,500 Nm

**N-ARPEX and ARPEX**  
all-steel couplings  
Rated torque:  
92 Nm ... 2,000,000 Nm

BIPEX-S and SIPEX

### Backlash-free couplings

The vibration-damping, electrically insulating plug-in BIPEX-S elastomer couplings and SIPEX metal bellows couplings with very high torsional stiffness deliver especially isogonal torque transmission.

**BIPEX-S and SIPEX**  
Rated torque:  
0.1 Nm ... 5,000 Nm

FLUDEX

### Hydrodynamic couplings

The FLUDEX hydrodynamic fluid coupling works according to the Föttinger principle. It functions entirely free of wear.

**FLUDEX**  
fluid Couplings  
Power:  
1.2 kW ... 2,500 kW

### Application-specific couplings

Couplings for rail vehicles must meet high demands. Due to their high degree of standardization and wide variety, they can be used in the most diverse vehicle types.

**Railway coupling**  
Rated torque:  
1,000 Nm ... 9,500 Nm

Each wind turbine coupling is designed to optimally meet the requirements of the respective wind turbine. The coupling connects the fast-running gear shaft with the generator shaft and is available for wind turbines with a capacity of up to 12 MW.

**Wind turbine couplings**  
Rated torque:  
10,000 Nm ... 60,000 Nm

# GENERAL

## Characteristic features

---

### Definite disconnecting

On reaching the set disconnecting torque ARPEX torque limiters separate the coupled drive components both during slow and fast rising torques.

### Complete separation

After the disengagement process the coupling halves are out of contact, so that in contrast to other torque limiter systems they come to a stop wearfree.

### Degressive characteristic

When the disengagement process starts the disconnecting torque decreases immediately, due to the degressive characteristic of the plate springs.

### Disconnecting process

The forces which originate from the disengagement process stay in the coupling system and are not transmitted to the coupled machines.

### High repetitive accuracy

The ARPEX torque limiters have a high repetitive accuracy of the disconnecting torque even after many disengagement processes. The repetition accuracy is  $\pm 10\%$ .

The design and manufacture of ARPEX couplings is integrated into a certified Quality Management System according to **DIN EN ISO 9001** to fulfil the high quality demands on ARPEX couplings.

### Reference points

Due to the spline geometry and by reference point markings, the coupling is always re-engaged in the same position.

### Backlash-free torque transmission

The spline system, machined to close tolerances, transmits torque positively and without backlash.

### High quality

All components of the ARPEX torque limiter are manufactured of high quality steel. This results in a compact, rugged design which guarantees a long working life with a high degree of operational safety.

### Ambient temperature

The couplings can be used in ambient temperatures from  $-30\text{ °C}$  bis  $+80\text{ °C}$ .

### Life lubrication

The bearings are lubricated for life.

### Smooth operation

ARPEX coupling components are machined to very close tolerances. Therefore, at speed, the assembled coupling imparts very small forces on the connected drive components.

# GENERAL

## ARPEX Safety Coupling Series

ARPEX torque limiters are used for all drive purposes where, for modern, high-grade and ever more expensive machines, a reliable protection in the case of overload is required.

The use of ARPEX torque limiters in plants avoids long periods of standstill and repairs caused by overload-defects. The economic efficiency of the plant is maintained.

In case of overload, ARPEX torque limiters disconnect the drive within the shortest time possible. Due to that fact operators and machines are protected.

ARPEX torque limiters are available in fourteen sizes for torques from 13 Nm to 65 000 Nm (higher disconnecting torques on request).

You can select two types of couplings:

### Standard design AKR

For combinations with standard components from the ARPEX- and N-EUPEX-programme  
**see page 22**

### Shaft mounting design AKA

For combinations with various specific drive media as belt-pulleys or chain wheels  
**see page 26**

Series AKR

Series AKA

Series AKR/ARPEX

Series AKR/N-EUPEX

## Design and operation

ARPEX torque limiters work with close fitting and positively engaged splines.

During normal operation of the machines the splines are kept in engagement by the spring tension of the plate springs, and so the torque  $T$  is transmitted from the hub over the disc pack to the indexing rings

In the case of overload the indexing rings turn relative to each other and press the splines out of engagement. At a defined point of the contact ratio the plate springs jump into a negative position. The splines are no longer in gear, the indexing rings have no contact and the torque transmission is interrupted.

Thus the coupling halves are out of contact after the disengagement process, they are wear-free. Due to the fact that the plate springs jump into a negative position the torque limiter will not re-engage by itself.

### Engaged coupling

### Disengaged coupling

# GENERAL

## Disconnecting at slow and fast rising torque

The disc pack allows the axial movement during the disengagement process and effects that the forces which originate from this process stay in the system of the torque limiter and are not transmitted to the coupled machines.

Due to their degressive characteristic, the disconnecting torque of the plate springs decreases immediately when the disengagement process starts.

The disconnecting torque is adjusted at the factory according to the customer's specification. The axial movement of the indexing ring can be used to actuate a limit switch, which switches off the machine.

The torque limiter can only be re-engaged when the plant is stationary. By the geometry of the splines it is guaranteed, that the indexing rings can only be engaged in one position.

Fixed point markings on the circumference, offset at 120°, will ease re-engagement; they have to locate one above the other on re-engagement.

The splines are engaged again by moving the disengaged coupling half back by either mechanical, pneumatic or hydraulic means.

Slow rising torque

Fast rising torque

## Selection

The disconnecting torque of the torque limiter should be at least 120% of the maximum torque occurring in the plant. Peak torques, as they for instance occur during start-up of a plant, should be considered.

Thus the disconnecting torque is calculated by the term:

$$T_A = 1,2 \cdot T_{\max}$$

The nominal torque of the assigned couplings (ARPEX/ARS-6, N-EUPEX) guarantees the operation of the plant even when the torque limiter is adjusted to the maximum disconnecting torque.

The permitted shaft misalignments can be drawn from the coupling catalogs of the ARPEX ARS-6 and N-EUPEX series.

## Ordering example

When ordering a torque limiter or a torque limiter combination, the **disconnecting torque** must be specified for each coupling-design, since it is adjusted at the factory.

## State of delivery

ARPEX torque limiters are supplied ready for assembly with the disconnecting torque – as per customer's specification – set.

Additional parts (ARPEX, N-EUPEX or RUPEX) are supplied as unassembled items.

## Technical information

- Change of dimensions and technical details are possible due to further developments.
- Rotating machine elements must be protected by the purchaser to prevent accidental contact.
- For installation and putting into operation, observe the respective operating instructions which are supplied with each coupling.

- Refrain from heating above +80 °C, because the working life of the bearing could be influenced negatively.
- Great flywheel masses (e.g. pulleys to actuate a limit switch) may only be flanged after consulting the manufacturer.

<sup>1)</sup> Higher disconnecting torques on request

## Notes

- Combination of torque limiter and torsionally stiff all-steel coupling to connect two shaft ends, type AKR/AR-EN.
- Design with bore and parallel keyway (with clamping hub also possible).
- E-spacer radial freely removable; with fixed shaft distances (for variable shaft distances H-spacer, AKR/AR-HN).
- Combination of torque limiter with all other hubs, spacers and flanges of the ARS-6-series is possible (see page 22).
- Weights and moments of inertia for coupling with maximum finish bores.

## Ordering example

- Hub AKR, size 04  
bore Ø 50 G7, keyway to DIN 6885-1 with set screw
- Hub N, size 140-6  
bore Ø 60 H7, keyway to DIN 6885-1 with set screw
- Coupling components to be dynamically balanced to quality G 6.3,  $n = 1450$  rpm with reference to DIN ISO 1940 part 1
- Hub AKR to be balanced after key seating,  
Hub N to be balanced before key seating
- Drive E-motor,  $P = 60$  kW,  $n = 1450$  rpm,  
Disconnecting torque  $T_A = 500$  Nm

on request

<sup>1)</sup> Higher disconnecting torques on request

## Notes

- Combination of torque limiter and flexible N-EUPEX-coupling to connect two shaft ends.
- Design torque limiter with bore and parallel keyway (design with clamping sleeve also possible).
- N-EUPEX: type D in three parts or type E in two parts (see catalog FLE 10.2)
- Type D enables shafts and machines to be separated without axial displacement. Type E at larger bore diameters D1
- Weights and moments of inertia for coupling with maximum finish bores.

## Ordering example

- Hub AKR, size 04  
bore Ø 50 G7, keyway to DIN 6885-1 with set screw
- N-EUPEX-coupling size 160, type D  
bore Ø 45 H7, keyway to DIN 6885-1 with set screw
- Coupling components to be dynamically balanced to quality G 6.3,  $n = 1450$  rpm with reference to DIN ISO 1940 part 1
- Hub AKR to be balanced after key seating
- Drive E-motor,  $P = 60$  kW,  $n = 1450$  rpm,  
Disconnecting torque  $T_A = 500$  Nm

**AKR 04/NE – D160**

# COMBINATION EXAMPLES

with standard components of ARPEX All-steel Couplings

1

Type AKR/AR-EN

Type AKR/AR-EB

- Standard type with fixed shaft distance dimension
- Machined all-over
- N-hub is reversible (B-hub)

Type AKR/AR-ON

Type AKR/AR-OB

- Standard type with fixed shaft distance dimension
- Machined all-over
- N-hub is reversible (B-hub)
- Shortest possible spacer

Type AKR/AR-AN, Type AKR/AR-HN

- H-spacer: Standard type with variable shaft distance dimension
- Great shaft distances are possible
- Spacer as welded construction
- A-spacer with fixed shaft distance dimension

Type AKR/AR-WN

- Connection of two half couplings with a solid shaft

Type AKR/AR-S-NHN

- This type is used to bridge large shaft distances. The S-intermediate shaft has to be radially supported by a pedestal bearing.

J-Hub

- J-hub, application on large shaft diameters
- J-hub is not reversible

Type 124, Clamping Hub

- Torque transmission by flexible clamp connection
- Without parallel key

Type 125, Clamping Hub

- Torque transmission by flexible clamp connection
- Without parallel key

C-flange

F-flange

D-flange

- Standard flanges can be used depending on type of machines to be connected

### Hinweise

- On request it is possible to supply dimension sheets for all combination examples of the torque limiter and the ARS-6 series.
- The size assignment of torque limiter and ARS-6-coupling should be the same as for the combination AKR/AR-EN (page 18)

# SHAFT MOUNTING DESIGN AKA

# COMBINATION EXAMPLES

with v-belt-pulleys, timing-belt-pulleys or chain wheels

The series AKA (shaft mounting design) can be combined with various pulleys and wheels. These could be e.g. v-belt-pulleys, timing-belt-pulleys or chain wheels. On request we offer complete solutions.

1

## AKA with v-belt-pulley

Dimensions of the v-belt-pulley acc. to customer's specification

Series AKA/KS

## AKA with timing-belt-pulley

Dimensions of the timing-belt-pulley acc. to customer's specification

Series AKA/ZS

## AKA with chain wheel

Dimensions of the chain wheel acc. to customer's specification

Series AKA/KR

# SPECIAL DESIGNS OF THE SERIES AKA

The ARPEX torque limiter can be combined with various drive media. As example two special designs of the series AKA with reinforced bearing for mounting of universal joint shafts respectively combination with the flexible RUPEX coupling are shown.

Apart from the series with ARPEX, N-EUPEX and RUPEX which are described in this brochure, the torque limiter can be adapted to most flexible couplings.

On request we offer complete solutions.

1

## AKA for mounting of universal joint shafts

The torque limiter is suitable for applications where universal joint shafts absorb the larger axial movement.

Hole arrangement to flange the universal joint shaft acc. to customer's specification.

Series AKA/GW

## AKA combined with RUPEX coupling

Apart from the flexible N-EUPEX coupling the torque limiter can also be combined with the flexible RUPEX coupling.

This combination is mainly intended for higher disconnecting torques.

The elastic synthetic buffers dampen and prevent the built-up of torsional vibrations, enabling critical speeds to be displaced.

By the limitation of the vibration amplitudes, the total machinery equipment is protected.

Series AKA/RU

# ACCESSORY

## Switching device

Functional manually operated lever for switching on and separation of the torque limiter.

On request it is also possible to offer a solution for an installed lever, which is integrated in the plant.

Dimensions in mm				
Size	A	B	C	D
02	146	300	32	12
03	168	340	33	12
04	193	400	38	12
05	214	450	39	15
06	250	475	42	15
07	264	475	47	15

11	550	850	94	25
12	610	1200	94	30
13	720	1500	131	30

## Limit switch

### Operation

If a metal object (in this case the indexing ring of the torque limiter) moves in the operating area of the inductive sensor (NAMUR-transmitter) a disconnection switch will be actuated and the drive will be switched off immediately through a relay. It is also possible to release an acoustic or visual signal additionally.

### Design

The NAMUR-transmitter can be activated from all sides. The transmitter is joined with the disconnection switch via a 2m-cable. The disconnection switch is furnished with a short circuit- (LK) and break-control (LB) of the cable, so that the voltage-supply of the transmitter is checked permanently. It has one relay output.

### Positive direction

The positive direction can be adjusted at the disconnection switch via switch S1a. During normal operation of the plant the relay is operating and the transmitter can either be covered or not covered.

Other designs of the NAMUR-transmitter also possible (other switching distances, other cable-length or with plug instead of cable connection).

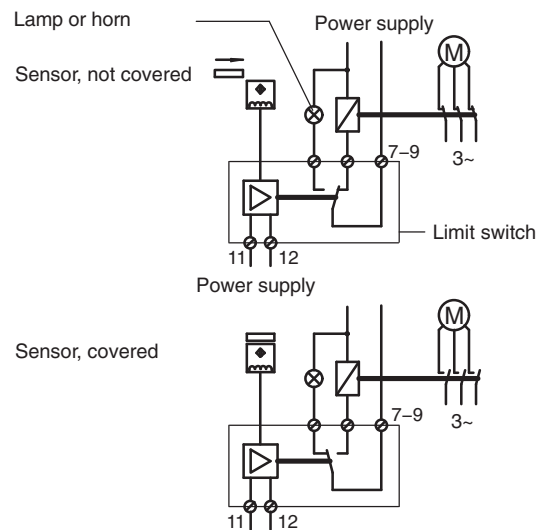

### NAMUR transmitter

### Disconnection switch

### Connection plan (switch S1a at position I)

Technical data	
Nominal voltage	AC 195,5 – 253 V, 45 – 65 Hz
Rate of power input	≤ 0,8 W
Contact load relay	AC 250 V / 2 A
Switching distance NAMUR transmitter	0 – 1,215 mm
Ambient temperature	–20 °C to 65 °C
Switching frequency	max. 25 Hz
Protection type NAMUR transmitter	IP67
Protection type disconnecting switch	Ex1
